

Musclewood

Carpinus caroliniana 'J.N. Strain'

The Johnson's Nursery, Inc.™ strain of Musclewood has been developed over a 30 year period by selective seed picking. Only seed from orange-red fall colored individuals is used for propagation. By doing this, we have changed the percentage of seedlings in our beds with orange-red fall color from about 15% to 80% or better. Our strain has superior vigor when compared to other seedlings being sold in commerce.

Our plants have originated from several ecotypes, brought together in our nursery to eliminate the inbred nature of the population in the wild. Our strain has hybrid vigor.
